

Acumatica Automated Data Capture (ADC) for Manufacturers

ADC TECHNOLOGIES, STRATEGIES, AND CONSIDERATIONS

Inventory and manufacturing data entry is historically time-consuming and prone to manual data entry errors. Paper shop floor documents, inventory receipt documents, and other physical information must be captured promptly. This playbook provides manufacturers with an overview of available ADC technologies and a framework for planning and executing ADC implementation projects to **streamline warehouse and shop floor data collection.**

4 EASY STEPS TO AUTOMATED DATA CAPTURE SUCCESS

INTRODUCTION

Getting Started with ADC – The Acumatica Way

Growing companies coming off entry-level accounting systems lack fully automated data collection. They may have a tethered barcode reader for some inventory and manufacturing transactions, but they could do more if they had the right platform. Perhaps the company is looking to move off a legacy ERP system and already has a warehouse management system (WMS) or manufacturing execution system (MES) that they love, and they do not want to replace it. The great news is that it may already integrate with Acumatica.

Acumatica provides **embedded barcoding and mobile capabilities** to streamline data capture from a wide variety of devices. Automate pick, pack, and ship transactions; use data capture for receiving and put-away; move inventory throughout your warehouse or manufacturing shop floor; and use automated technologies for labor entry and material issues to production orders.

With Acumatica, you have an adaptable and modular cloud ERP system **ready for Industry 4.0 technologies** such as artificial intelligence and machine learning. Acumatica easily connects to external systems making it a breeze to automate your business with plenty of choices in technology partners. You can start slow with barcoding, utilize the built-in mobile capabilities for **clock-in and clock-out of production jobs**, and leverage built-in automation features for backflushing and phantom bills of material – and then move into more advanced technologies such as RFID, voice-directed warehousing, machine interfaces, and full WMS or MES features.

“Before Acumatica, our version of checking inventory was a sales guy running to the warehouse to ask how many units we had... Now we have location-based picking so anyone can bring the product into manufacturing... Having Acumatica integrated with manufacturing allows us to manage all our inventory from a single location. We can easily look it up in the system and have confidence that it’s accurate.”

- CHAD TREADWELL, VP OF OPERATIONS FSC LIGHTING

1. ADC TECHNOLOGIES

Automation Options

In 1974, the first UPC scanner was used to scan a 10-pack of Wrigley's Juicy Fruit chewing gum. Since then, automated data capture technologies have matured from barcodes to radio frequency identification (RFID) to PLC machine interfaces and **artificial intelligence, and machine learning** to automate data capture that could only be imagined just a few decades ago.

“We're constantly trying to automate things with the goal of minimal data entry... We want Acumatica to be quick and help us make as few mistakes as possible along the way to keep the customer happy—that's what this business is all about.”

- PATRICK MADISON, CFO KORPACK

[View Success Story](#)

PAPER - BASED

Paper-based data capture is not entirely evil. It has a place in manufacturing and can be a cost-effective way to capture data for specific types of inventory and manufacturing transactions. However, it has many downsides and the goal for automation is speed and accuracy, something that cannot be carried out easily with paper.

Acumatica provides embedded document management and manufacturing reports.

PROS:

- Easy to implement
- Typically, very low cost
- Physical record of the data

CONS:

- Not real-time
- Requires manual data entry
- Prone to data entry errors

BARCODE

Barcodes are among the most common data capture technologies. Barcodes come in many different styles and work with different devices including mobile devices, keyboard wedge devices, ruggedized tablets, and specialized scanners. Carefully consider the label format, label media, and printers used in harsh industrial environments.

Acumatica WMS & Manufacturing Data Collection provide out-of-the-box automation.

PROS:

- Compatible with most systems
- Relatively low cost
- Accurate data in real time

CONS:

- May require some data entry
- Some compatibility issues
- Requires configuration

RFID TAGS

Radio frequency identification (RFID) provides passive data collection as tags on inventory pass near radio receivers. RFID has advanced with lower costs, improved accuracy, and the ability to capture more data such as temperature, triangulation of location, and even bacteria counts.

Acumatica's Cloud xRP Platform with Open APIs facilitate fast and easy integration with RFID and other ADC technologies.

PROS:

- Accurate, real-time data
- Moderate costs after setup
- Minimal human intervention

CONS:

- Can be difficult to configure
- Higher initial investment
- Sometimes unreliable

ERP FEATURES

Some ERP systems can simulate automated data capture. For example, backflushing captures data for labor and material transactions using pre-defined bills of material and routing standards. Phantom bills of materials and after-the-fact production reporting are other common areas where ERP can streamline data capture.

Acumatica supports backflushing and phantom bills of material.

PROS:

- Easy to setup and use
- Typically, no cost (included in ERP)
- Fast and accurate data capture
- Requires minimal training

CONS:

- Can be difficult to configure
- Higher initial investment
- Sometimes unreliable

OCR SCAN

Optical Character Recognition (OCR) technology recognizes letters, words, and characters, captures data, and stores it in a system – typically a document management system. OCR is useful for external documents without barcodes.

Acumatica's embedded document management combined with leading scanning applications on the Acumatica Marketplace provide great options for OCR scanning.

PROS:

- Easy to setup and use
- Typically, very low cost
- Good for external documents

CONS:

- Not real-time
- Some manual effort
- Some character recognition errors

VOICE RECOGNITION

Voice-recognition is relatively new for automated data capture. Manufacturers and distributors often use voice directed warehousing (VDW) often with wearable technology to automate transactions including picking, packing, put-away, inventory movement, production reporting, and to search for information via chatbots and virtual assistants.

Acumatica is designed for use with AI Chatbots & Virtual Assistant technologies.

PROS:

- Easy to learn and to use
- Fast, hands-free data capture
- Accurate data in real time

CONS:

- Background noise issues
- Higher costs for configuration
- May require barcode scanners

TIME CAPTURE

Many time clock applications can be configured to collect data for shop floor labor reporting, and time entry for payroll and human resources. Biometric technologies enhance time capture by using fingerprints, facial recognition, or iris scans to validate who is posting the transaction.

Acumatica Manufacturing Data Collection captures clock-in and clock-out data for jobs.

PROS:

- You may already own them
- Moderate investment
- Easy to setup and to use

CONS:

- Some not compatible with ERP
- Biometrics can get costly
- May not work on mobile

ROBOTICS, SCADA, PLC

One cannot help but think of robotics when discussing automation. Robotics and machines capture massive amounts of data that can be stored using programmable logic controllers (PLC) and hardware and supervisory control and data acquisition (SCADA) applications. They can capture material usage, run times, and data such as temperatures, humidity, and more.

Acumatica's open xRP Platform provides fast integration with external sources including robotics, SCADA, or PLC through web services.

PROS:

- Fast and efficient data capture
- Additional data often available
- Typically, very reliable

CONS:

- Hardware can be expensive
- Configuration can be costly
- Some system compatibility issues

MOBILE DEVICES

Historically mobile devices used in industrial environments included specialized and rugged scanners or tablets that affixed to forklifts or work centers. Newer mobile devices such as smart phones are becoming more common but may have some limitations compared to traditional scanners.

Acumatica's Mobile Framework supports iPhone/IOS, Android, and other mobile devices.

PROS:

- Improved compatibility
- Relatively low cost
- Easy to setup and to learn

CONS:

- Some system compatibility issues
- Many devices are not ruggedized for harsh industrial environments

WMS SYSTEMS

Warehouse Management Systems combine multiple technologies including bar coding, mobile, RFID, voice, and others into a cohesive system for automating inventory transactions and movement. This automation is done throughout the receipt, production, and shipping process as well as physical inventory counts, and more. Manufacturers may use light WMS features inside their ERP system or integrate more advanced WMS applications.

Acumatica provides barcode printing on documents and reports and a WMS system for automated inventory transactions.

PROS:

- Advanced automation
- Defined workflows and rules
- Integration with ER

CONS:

- More complex to implement
- Higher investment costs
- Dependent on other technologies

MES SYSTEMS

Manufacturing Execution Systems leverage other automation technologies in an advanced system to manage production including schedules, labor assignments, performance analysis, maintenance, quality, document control, and other manufacturing shop floor functions.

Acumatica is an adaptable platform designed for rapid integration to external systems.

PROS:

- Holistic and comprehensive system
- Fills many gaps in ERP capabilities
- Can have high return on investment

CONS:

- Expensive to purchase/license
- Complex to configure
- Can be difficult to use

AI / ML

Artificial Intelligence (AI) and Machine Learning (ML) promise to improve many aspects of manufacturing including data capture. AI can be used to compare manually entered data against expected standards to validate data that is outside the expected norm. Machine learning can be used to improve on AI and other types of data capture.

Acumatica's Alexa for Business and xRP Platform are designed for artificial intelligence and machine learning.

PROS:

- Validated data
- Potential for full automation
- Adaptable with human corrections

CONS:

- Not yet available for many systems
- Requires training to implement
- May have high investment costs

LEAN STRATEGIES

Lean manufacturing encompasses different strategies that lend themselves to automation. These include single minute exchange of dies (SMED) for setups, Kanban for pull-based material transactions, and other strategies that work well with ADC.

Acumatica is an adaptable platform designed for rapid integration to external systems.

PROS:

- Many companies using Lean
- Compatible with most ADC technologies
- Generally low cost, high reward

CONS:

- Few defined use-cases
- Technologies may interfere or conflict with lean objectives

“With Acumatica, someone can log in at any time, refresh the screen, and see live data on product to determine what product the team should focus on, rather than building things we may or may not need depending upon how demand has changed.”

- CHAD LOCKWOOD, PRESIDENT / CEO
LOCKWOOD PRODUCTS

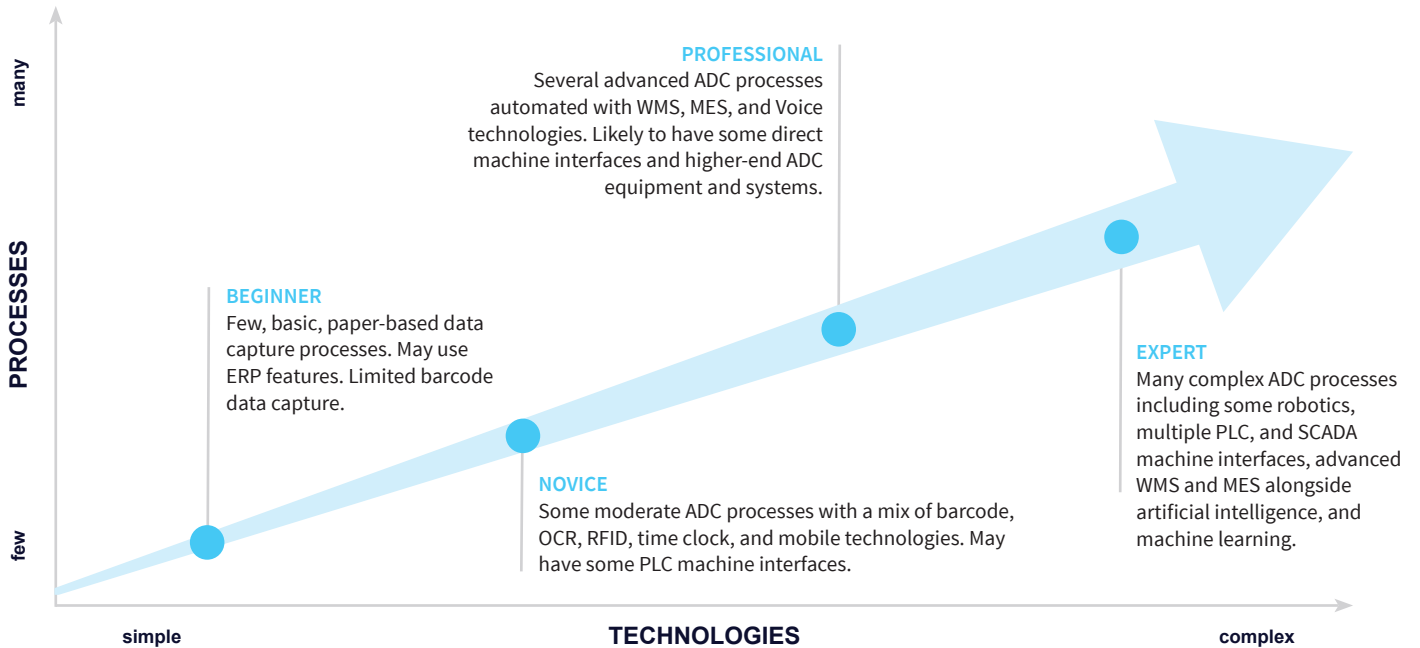

[View Success Story](#)

2. ADC ASSESSMENT

Where Are You in Your ADC Journey?

The strategies you implement for automated data capture depend on how far along you are in your ADC journey. Manufacturers who are just starting will have few ADC processes in place using basic technologies. Manufacturers further along will have more automated processes using progressively more advanced technologies. The first step is to understand where you currently are before developing an ADC plan. Use the table and diagram below to chart your journey.

	Automated Processes	Paper Processes	ERP Features	Barcode	Mobile	Time Capture	OCR	RFID	PLC & SCADA	MES	WMS	Voice	AI / ML
Beginner	0-10	●	●	◐	◐	◐	◐	○	○	○	○	○	○
Novice	11-20	●	●	●	●	●	◐	◐	◐	○	○	○	○
Professional	21-30	●	●	●	●	●	●	●	●	◐	◐	○	○
Expert	31+	●	●	●	●	●	●	●	●	●	●	◐	◐

● Commonly Used
 ◐ Occasionally Used
 ○ Rarely Used

3 . ADC STRATEGY

4 Steps to ADC Success

A successful ADC strategy starts with a solid foundation. It is critical to start with a **modern ERP** application that provides native data capture capabilities and an **open architecture** to connect advanced ADC technologies as you progressively automate data capture throughout inventory and manufacturing processes. Understand available options, research potential solutions, prioritize your initiatives, and develop a detailed plan for the project.

MANUFACTURING EXECUTION SYSTEM INTEGRATION WITH ACUMATICA

“Some of our operations, we’re entering data live on the floor, so it accesses the production data and updates the inventory in real time which is key.”

- DAVID GREEN, CHIEF COMMERCIAL OFFICER OFS INTERNATIONAL

[View Success Story](#)

STEP 1

Foundation

Implementing ADC is easier when you build on a modern ERP system. It will be much more difficult and costly to implement ADC if you are using basic accounting or older ERP systems with few integration options and limited ADC application technology providers. **BEGINNERS** and **NOVICES** are typically moving to their first real ERP system. They should carefully consider their ERP platform. Even **PROFESSIONALS** and **EXPERTS** need to review their underlying ERP – especially if they are on an unsupported or legacy system.

Actions:

- 1. Review Current ERP Features:** What ADC features does your current ERP system provide? Does it support barcode printing and scanning for inventory and shop floor transactions? Does it require additional licensing or third-party applications? Are there limitations on the types of data you can capture or the methods you can use for data capture (e.g., barcode, RFID, OCR, or PLC)? Are features available if you upgrade or add new modules to your current ERP platform?
- 2. Upgrade or Replace ERP:** Consider upgrading or replacing your current ERP software before implementing ADC if your current ERP has limited ADC capabilities or the underlying technologies prohibit or restrict your ability to integrate with current and future ADC technologies and applications.

STEP 2

Research

It is critical to research and document ADC strategies and technologies so you can prioritize initiatives and evaluate ADC solutions before developing a plan. Pay special attention to where you are in your ADC journey. The further along you are, the more opportunities there are to go back to improve previous ADC initiatives.

Actions:

- 1. Research Existing Capabilities:** Document ADC capabilities available inside your current (or potential replacement) ERP system. How are these capabilities used in the system today? Can they be improved, or should they be replaced?
- 2. Identify ADC Initiatives:** Develop a list of data transactions that you could automate with ADC technologies. Make notes on why these transactions would be good candidates for automation and what your process improvement goals are.
- 3. Review Potential ADC Technologies:** Contact your ERP partner to learn more about available technologies for automated data capture. Which technologies are available? Can they be integrated with your current or proposed ERP system? What are the costs for licensing, installation, configuration, and training?

STEP 3

Prioritize

Review existing ADC initiatives and look for ways to improve them. Rank initiatives based on cost and potential benefit from the list you created in Step 2. **BEGINNERS** need to start small with a few high-priority processes. **NOVICES** should look for new ways to expand on ADC technology investments. **PROFESSIONALS** and **EXPERTS** should improve processes with more advanced technologies in areas where they have yet to automate transactions or where new technologies can offer an improvement on earlier ADC projects.

Actions:

- 1. Improve Existing ADC Processes:** Review previously completed ADC projects. Often, you will find ways to improve data capture by implementing new features available from the technology providers or by replacing the ADC technologies with newer, more versatile solutions. Sometimes these improvements are more beneficial than implementing entirely new ADC projects.
- 2. Implement New ADC Processes:** You cannot automate everything at once so it's important to use the prioritized list to formulate a plan. Consider those that can be implemented quickly using existing functionality in your ERP system or where you can use earlier investments in ADC technologies. Start with processes that provide the highest possible return on your investment first and work your way down the list to initiatives that provide less value.

STEP 4

Develop A Plan

The final step in developing an ADC strategy is to **document the implementation plan**. The plan should include the desired goal of each ADC initiative and its supporting technologies, and a **thorough timeline** and process for conducting the implementation from start to finish. This step is crucial for every manufacturer regardless of where they are in their ADC journey.

Actions:

- 1. Goals & Desired Outcomes:** Too many projects fail because the implementation strays from the initial goals outlined in the plan. It is vital to clearly outline the expected results. For example, you may want to reduce the steps it takes to capture data from 5 to 1. You may want to reduce the time it takes to capture data by 80% for a defined transaction or process. Or you may want to reduce data entry errors by 90% for a process. Document the current state before implementing the ADC technologies so you have a benchmark to use as a measure of the success of the project.
- 2. ADC Technologies:** Which ADC technologies will be used to automate the process? Sometimes this can be a single technology such as barcoding or a mix of technologies such as voice and barcoding used for inventory picking. Document which technologies will be used, dependencies and integration points with other systems, known limitations, and provider contacts for technical and consulting assistance.
- 3. Timeline:** The timeline for each initiative should be well-defined. You may not have a start date for the project, but you can develop the detailed phases required for the implementation with a timeframe defined to complete each step in the process. How long will it take to secure the technologies? How long will it take to configure them? How long will it take to test? How long will it take to train users? And how long will it take to go live on the new technologies?
- 4. Contingency Plans:** Define contingency plans in case you run into technical issues or other conflicts that prevent the completion of the project. Consider running new ADC processes in tandem with earlier processes as a back-up.

ROBOTICS INTEGRATION

“Right now the exciting thing happening in addition to Acumatica is the introduction of robotics and automation to our industry and we recently have been able to introduce a couple robots who are going to be doing some of the labor here moving the plants around so that’s something we’re very excited about.”

- TIMOTHEE SALLIN, PRESIDENT IMG ENTERPRISES

[View Success Story](#)

STRATEGY TIPS

Prioritizing ADC projects can be difficult. Everything will seem equally important to automate and it is easy to give more weight to projects that are easier to implement rather than those that may take more time but could provide potentially **higher value** to the organization. The following are some suggestions to consider when prioritizing ADC projects with special consideration for where you are in your ADC journey.

“Carrying a multimillion-dollar inventory, you’ve got to have good controls for that...With the new controls that Acumatica has in place, our inventory is much more accurate.”

- ROGER COLLINS, CFO DEMTECH

[View Success Story](#)

SIMPLE

Some transactions lend themselves naturally to automation with low-cost technologies such as using native ERP features like backflushing or simple ADC technologies like barcoding. **BEGINNERS** should start with ERP features and basic barcoding with keyboard wedge devices for a few processes while **NOVICES** may expand to more automated processes using advanced barcode scanners. Simple projects tend to have a higher priority because they are low cost.

TARGET TRANSACTIONS

- Material transactions
- Job clock-in / clock-out
- Production entry (backflush)
- Inventory movement
- Inventory receipts
- Finished goods entry

ENTRY ERROR

All manual data entry activities are prone to error, but some are more apt to have problems due to the volume or complexity of the data. **BEGINNERS** should target a few transactions that are most prone to error while **NOVICES** should target multiple transactions with more complex data capture requirements. It is common to place a higher priority on transactions with higher volume of data capture or where the company has experienced significant data discrepancy issues in the past.

TARGET TRANSACTIONS

- Picking and put-away
- Shipment transactions
- Packing transactions
- Inventory adjustments
- Production entry
- Lot/serial transactions

COST-EFFECTIVE

Cost-effective transactions have a low investment in automation technology compared to the potential cost savings. As such, they are among the first transactions to be automated.

BEGINNERS can look for simple manufacturing and inventory transactions while **NOVICES** may look at more complex automation such as scale integration or lean manufacturing transactions. It is imperative to define the total cost and the desired outcomes to determine how cost-effective these projects really are.

TARGET TRANSACTIONS

- Material issues
- Labor entry
- Lean (Kanban)
- Warehouse transfers
- Inventory receipts
- Scale Integration

TIME-INTENSIVE

Some data entry takes more time than others. **PROFESSIONAL** ADC users will begin to automate some time-sensitive transactions while **EXPERT** users will automate complex transactions that may require sophisticated technologies. It is important to document data capture processes first. Then conduct research to understand how long each process takes to complete. It is only then that you can get a clear picture of how much time it truly takes to complete the process without ADC.

TARGET TRANSACTIONS

- Inventory receipts
- Machine downtime
- Inventory movement
- Shipment transactions
- Product returns
- Production entry

TIME-SENSITIVE

Lags in data capture for many ERP transactions can cause serious inaccuracies for material planning, scheduling, and shipping. Time-sensitive transactions tend to be more complex. While all manufacturers will target time-sensitive transactions at various stages, **PROFESSIONALS** will begin to target a few time-sensitive transactions while **EXPERTS** will focus on a larger number of them with increased complexity.

TARGET TRANSACTIONS

- Inventory receipts
- Machine downtime
- Inventory movement
- Shipment transactions
- Product returns
- Production entry

“Acumatica has an open platform, which was a huge selling point. The company looks for outside innovation and to work with as many ISV’s as possible to provide a multitude of solutions. We believe in that ethos because that’s how we operate.”

- **FRANKLIN SHIRAKI, CORPORATE CONTROLLER FIREWIRE SURFBOARDS**

[View Success Story](#)

4 . ADC EXECUTION

ADC Implementation Phases

Now that you have a clear-cut, prioritized ADC plan in place – it is time to execute on the plan.

Execution covers four phases: Preparation, Go-Live, Review, and Continuous Improvement.

Each phase is essential for the **successful roll-out** of new ADC strategies and the on-going maintenance and support required to ensure their long-term success.

PHASE 1

Preparation

You need time to prepare for every ADC implementation. The time it takes to prepare will depend on the complexity of the project including the technologies used and the number of transactions you plan to automate.

For example, it may only take a few days to prepare for a barcoding project for a few inventory and manufacturing transactions. Conversely, implementing WMS, MES, or artificial intelligence and machine learning may require weeks or months of preparation.

In either case, preparation should start well before your desired go-live date and should include a review of the project plan with all project owners and contributors including internal staff, users, technology providers, consultants, and potentially vendors and customers if transactions are dependent on data they provide or if the data capture will impact their business processes.

Actions

- **Plan Review:** Review the implementation plan with the internal and external team. Make final adjustments as needed. Set the start date for the project and assign dates to each step in the implementation project. Define who owns each process and who contributes to each step. Consider the contingency plan and ensure that there is a process in case something goes wrong or resources become unavailable.
- **Team Preparation:** Notify all participants in the project of the timelines and their roles and responsibilities. Make sure they are available and trained on the technologies involved in the implementation. Do not forget to include external resources such as the technology provider, their solution consultants, and others who play a part in the project. You may also consider conducting a conference room pilot (CRP) and run through of the go-live implementation using a test system to further improve your chances for success as many issues are identified during the CRP exercise.

PHASE 2

Go-Live Day

The plan has been set, it has been reviewed, the team is assembled and trained, and it is time to execute on the ADC implementation project.

A successful go-live is well-organized. One person should be identified as the project lead. Everyone else should be working with the project lead who orchestrates the steps in the project.

Actions

- **Coordination:** The project lead will orchestrate the implementation, delegating tasks to each team member and providing assistance or guidance throughout the project. They will make last minute decisions based on feedback from the team and they will chart the progress of the project as tasks are completed.
- **Documentation:** The actual go-live should be as close as possible to the planned implementation. However, it is inevitable that some last-minute changes happen along the way. Document what changes were made and why those changes were made so that you can review them after the implementation is complete.

PHASE 3

Review

It may take a few days or even a few weeks for things to settle into place after you complete the ADC project.

Make sure to wait at least a week (preferably a month or longer) before reviewing the project. This will give users time to get used to the new processes while providing time to collect data to determine if the project was a success.

The review process should include notes from the go-live event, feedback from users, and early analytical results.

Actions

- **Go-Live Notes:** Review the go-live notes for details on last-minute changes to the project plan. Identify if there are any follow-up activities that need to happen to fine-tune the process or to address technology issues that occurred during the go-live.
- **User Feedback:** Talk to users of the new ADC technologies. What do they like about the technology and the new processes? Do they feel they are beneficial? Do they need more training? Have they embraced the processes? What do they suggest will make the process even better? You will often find that users have some of the best ideas if you take the time to ask them.
- **Analytics:** Now is the time to look at the early results from the project. Were you able to meet or surpass your goals? If not, why? And what can you do to improve the process so you can achieve the desired results? Develop a plan to capture data periodically to continue analyzing the results of the ADC project.

PHASE 4

Continuous Improvement

An ADC project is never finished. You must continually monitor the results to ensure that employees do not slip back to previous processes. Technology upgrades and other issues can also change the effectiveness of the original ADC project.

Every ADC project must be maintained. There is always room for process improvements and new versions of the software or hardware that can provide more value while ensuring the technologies continue to function as expected.

You may also find new ways to reconfigure the process or ways to extend the project to automate even more data or other transactions.

Actions

- **Monitor User Adoption:** It is not unusual for users to fall back to old processes even if they initially appear to be on board with the new plans and procedures. Monitor user activity periodically to identify users who have embraced the new processes and those who need more encouragement. You may also consider disabling manual data entry or limiting access to alternative data capture methods for certain users after the successful go-live on the new ADC technologies.
- **Maintain Technologies:** Stay current on the latest updates and versions of your ERP software and connected ADC technologies. Setup a sandbox for testing upgrades to ensure compatibility before upgrading live production systems. Review product road maps and talk to technology partners to understand the lifecycle for the technologies you have implemented. They may drop support for some critical technologies, or they may provide a better option as a replacement to your current technologies.
- **Improve Processes:** Managing technology implementations is no different than implementing lean Kaizen and other continuous improvement projects. Utilize the same methodologies to seek out ways to improve processes – even those that have already been automated with ADC.
- **Explore New Opportunities:** There is always a process that can be automated – ALWAYS! Continue to look for new ways to extend your ADC investment to other types of data as your organization moves from Beginner to Novice, to Professional to Expert stages. Take on more complex ADC projects and consider more advanced technologies as they become available.

EXECUTION TIPS

Managing ADC implementations **can be difficult without the right tools**. Acumatica includes a Project Management module to plan for ADC projects with integrated Case Management and Support to manage support activities, Wikis for documenting policies and procedures, and even Field Service for managing technology installations, upgrades, and other project-related activities.

“ERP deployments have a very high failure rate. But we did in fact launch half the system exactly on time and half the system one day late which is rare and the project overall over the last year we’ve been using it has come in right around on budget which is also very rare.”

- BRAM KLEPPNER, CEO DANFORTH PEWTER

[View Success Story](#)

PROJECTS

Acumatica includes a project management module that is perfect for setting up and managing automated data capture and other internal IT or manufacturing projects. You can define project budgets, create tasks with planned and actual start and end dates, assign a project manager, manage project resources, track project costs (with direct integration to Purchase Orders and PO Requisitions for purchased equipment and services allocated directly to the project), and provide for employee time and expense entry with mobile scanning for receipts, keeping all the information you need in one system.

SERVICE REQUESTS

Acumatica Case Management integrates with Service Management for larger manufacturers who need to schedule services, upgrades, and other IT activities for installed technologies, hardware, and applications. Service Management provides service tickets, technician scheduling and dispatch, mobile time and service order accessibility, and a whole lot more.

SUPPORT CASES

Use the Acumatica CRM suite to manage support cases for installed technologies such as Automated Data Capture or for issues related to the implementation itself. Cases can be related to projects, accounts, and contacts, and keep critical information connected. Cases are assigned to an owner in your help desk with date fields for when the issue was reported and resolved, severity and priority codes, and status. Document case activities with notes. You can even attach files and setup notification workflows to keep everyone in the loop.

WIKIS

By using Acumatica wikis, users create, edit, and share information. Wikis are ideal for documenting use-cases for ADC and other technologies. Develop procedure manuals, embed training videos, attach user manuals, and share everything with employees and external business partners or consultants. Wikis provide version tracking and security.

Automated Efficiency with Acumatica

We are currently on the precipice of a new era in automated data capture. While many companies are just starting with barcoding, RFID, and basic automation available in their ERP systems, others are implementing sophisticated technologies including PLC/SCADA, WMS, MES, artificial intelligence, and machine learning.

ADC drives efficiency throughout manufacturing and inventory processes making data entry faster and more accurate. Manufacturers in every stage of their ADC journey can improve processes by setting a solid ERP foundation, researching available technologies, prioritizing ADC initiatives, and developing a detailed project plan. ADC project success is dependent on preparation, systematic go-live activities, on-going reviews, and continuous improvement of both processes and technologies.

Acumatica Manufacturing Edition is a future-proof, cloud ERP application built on a modular and adaptable platform with native automated data capture and open APIs for rapid integration with external data capture devices and systems to help manufactures thrive in the new digital economy. Acumatica is designed for midmarket manufacturers that struggle with disparate, siloed systems for production, CRM, warehouse management, field service, financial, and business intelligence applications by providing an end-to-end business management solution that can be accessed in the cloud using a standard web browser or mobile application with built-in barcode scanning.

ABOUT ACUMATICA

Acumatica Cloud ERP provides the best business management solution for digitally resilient companies. Built for mobile and telework scenarios and easily integrated with the collaboration tools of your choice, Acumatica delivers flexibility, efficiency, and continuity of operations to growing small and midmarket organizations.

Business Resilience. Delivered.

Learn more about how Acumatica can work in your business by visiting us online at www.acumatica.com.
