DataStealth
## For Test Data Management

SIMPLE DEPLOYMENT
DataStealth is a plug-and-play platform that can deploy in as little as 2 weeks.

PROTECTION EVERYWHERE
Get protection for data in all systems within your environment, including Cloud Applications and storage.

PROTECTION FOR EVERYTHING
DataStealth is technology agnostic and works with any protocol, any payload, any data type.

DataStealth for Test Data Management

Managing the risk of production data use in lower level environments is a daunting task.

Implementing a plug and play solution like DataStealth enables companies to adopt a TDM approach that facilitates a self-serve model for developers and testers to access new test data sets, remove manual intervention, and eliminate any infrastructure requirements of master 'golden copy' or derivative test data sets. When moving data from a production environment to a development environment, DataStealth can obfuscate regulated and/or restricted information as the data flows across the network. Developers, analysts, and researchers are able to work with fully obfuscated data, significantly reducing the risk profile.

With DataStealth, Intruders Cannot Steal What Is Not There.
