The Experts in Protecting Public Health

Mosquito Control
for homes

Protecting your home, family and pets from biting insects

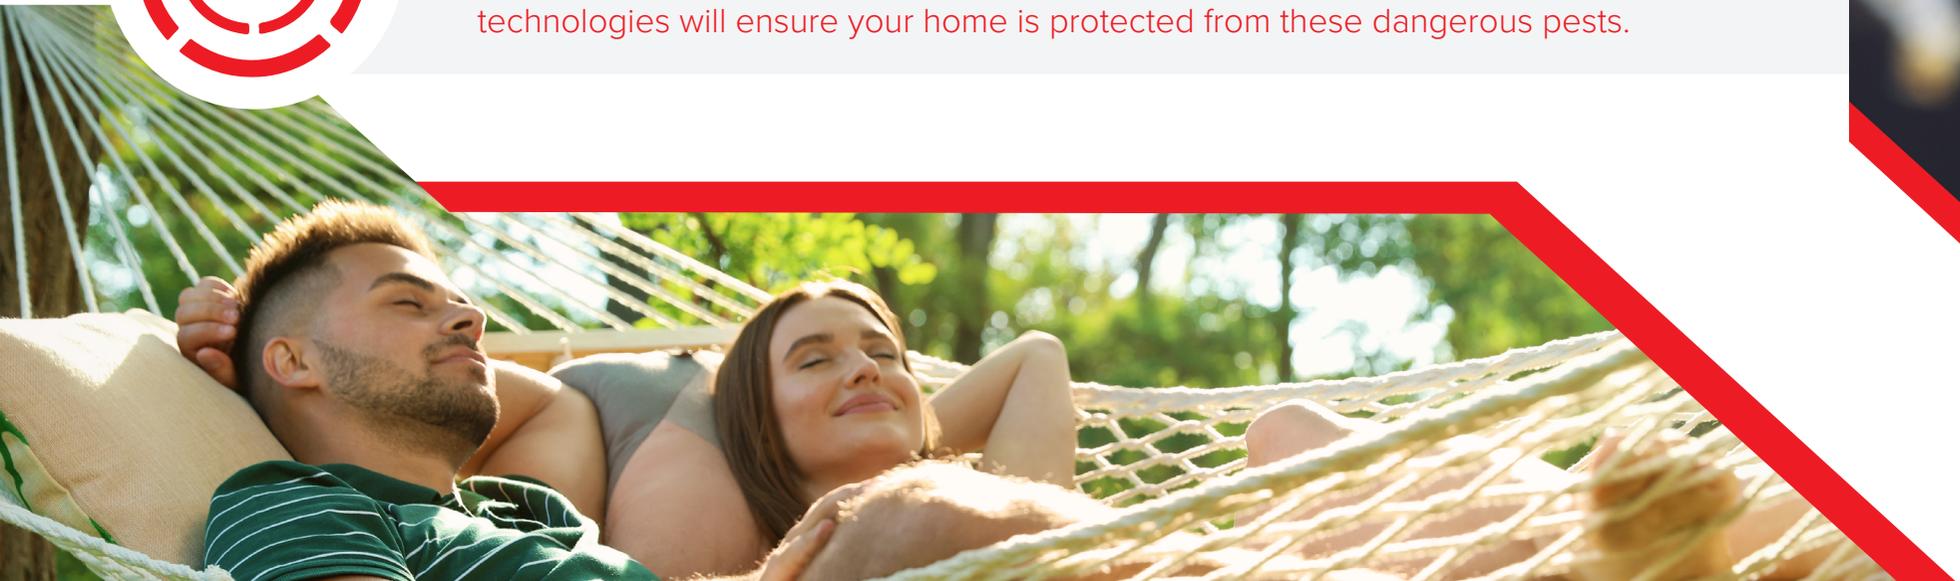

Warm, wet weather means mosquitoes come out in force and invade your home in search of a blood meal and places to lay eggs.

The need for blood makes them one of the most irritating and dangerous pests to us humans and to our pets. They not only cause inflamed bites but are responsible for spreading diseases such as dengue, malaria, West Nile virus, dog heartworm and eastern equine encephalitis. They're responsible for transmitting more dangerous diseases worldwide than any other animal.

Protect the health and wellbeing of your family now with a Rentokil mosquito control solution tailored to your needs.

Our expertise and environmentally friendly treatments using advanced technologies will ensure your home is protected from these dangerous pests.

How Rentokil can help protect your family

Any outdoor activity around the home – relaxing in your back yard, playing with children and pets or mowing the lawn – exposes us to these blood-seeking insects.

It's essential to take steps to manage mosquito infestations for the comfort and safety of you and your family.

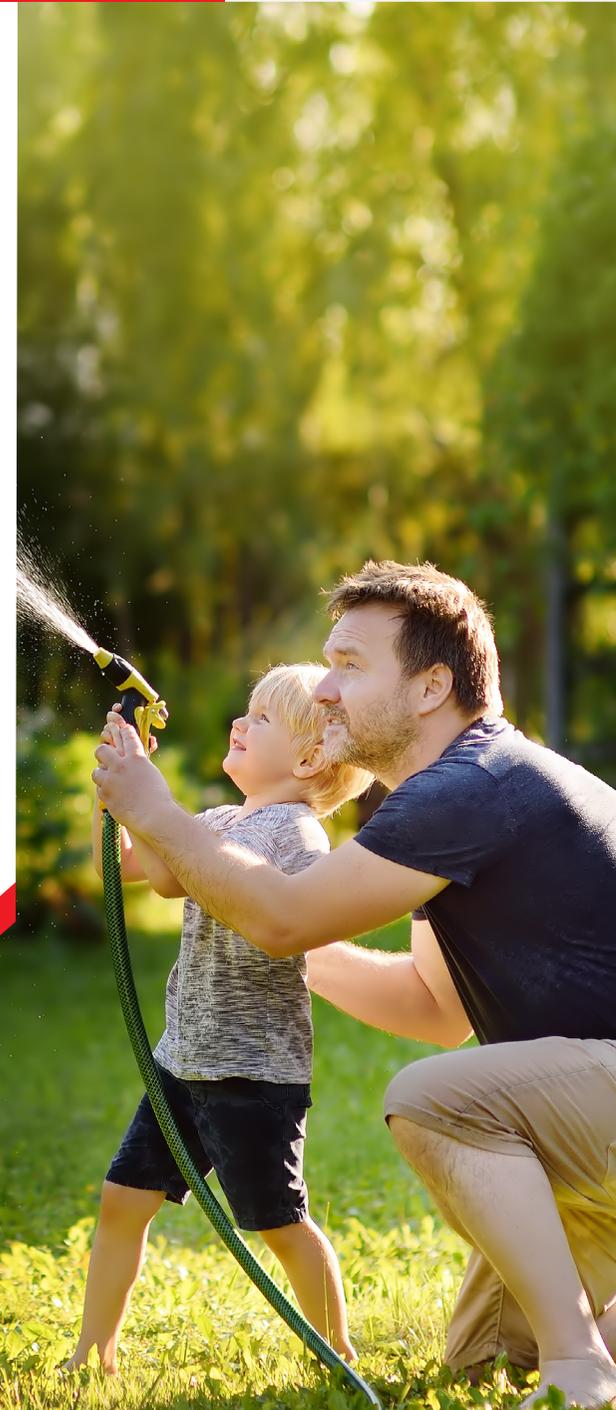

Mosquitoes only need a small amount of stagnant water to lay their eggs. This means that plant containers, ponds, gutters, flat roofs, puddles and even discarded household containers can become mosquito development sites.

Mosquitoes will also make their way indoors and find places to rest before seeking a blood meal or sites for laying eggs. If you have plant containers in your home or air coolers with standing water, the mosquitoes will have safe places to lay eggs and the next generation will have a ready supply of your family's blood for feeding.

There are some measures you can implement yourself to reduce the mosquito population, but, for a greater level of protection, we have the expertise, resources and experience of a global company that's been operating for decades at a local level.

Our integrated mosquito management solutions (IMM) use a range of advanced technologies that can protect your home more effectively than home solutions.

Our environmentally friendly treatments will control mosquitoes safely at every stage in their lifecycle and continue to protect you throughout the year. We also provide you with expert advice on how to remove breeding sites and maintain protection from these dangerous pests.

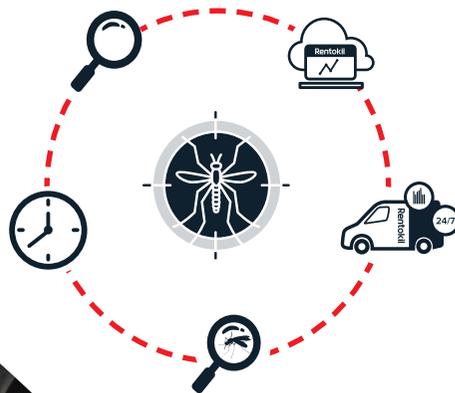

Our mosquito expertise

At Rentokil, we believe in and promise to protect people and enhance lives, so guarding health, property and the environment are our main priorities.

Preventing harm from mosquitoes and other disease-carrying insects is one of our global commitments.

Rentokil has over 25 years' experience in mosquito control, giving us a deep understanding of the health risks that they pose in and around your home. We understand how important protecting the health of you and your family is, so we go further to protect you.

We combine our knowledge of mosquito biology, species, development sites and disease potentials with detailed inspection and monitoring information to develop a tailored, flexible solution for each customer, whether that's for a small residence or large multi-family housing block.

Our mosquito expertise

Safety is essential

Safety is always our priority. Our solutions are effective because we integrate innovation with established industry standards and legal requirements to maximise our control efforts while protecting health, property and the environment.

World-class expertise for local solutions

Our **Vector Management Centre of Excellence** brings together experts from around the world to consolidate and share best practices, support innovation and develop new solutions.

Our investment in research and development is unrivalled, combining our practical know-how with that of the specialists in our dedicated insect laboratory in our **Global Research and Development Centre**.

This is at the forefront of behavioural science and observational research, which gives us a solid foundation for the consistent delivery of new control and prevention methods for you and all our customers world-wide.

Our mosquito expertise

Leading mosquito-control solutions

We deliver targeted outcomes by harnessing the latest innovations to deliver safe, regulated and effective treatments for mosquitoes, including advanced environmentally friendly biocides.

Our discrete, reliable, holistic solutions are delivered by highly professional, expert technicians and include:

Mosquito population monitoring and disease detection

Indoor and outdoor trapping

Adulticiding

Education

Larviciding

Consultancy

What you can do to prevent mosquitoes

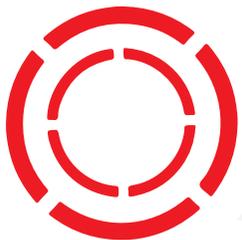

Your home can provide many opportunities for mosquitoes to breed and feed.

You can take some easy, inexpensive measures to remove mosquito development sites and reduce the mosquito population.

Many man-made objects that can hold water provide ideal environments for egg laying around our homes and businesses.

Target these to control mosquitoes.

- Remove all discarded bottles, cans and other water-holding containers
- Cover water tanks and septic tanks
- Clean gutters and drains so they don't have standing water
- Stock ponds or ornamental water features with native fish that eat mosquito larvae
- Change the water frequently in pot holders, bird baths, pet bowls and water troughs for horses and cattle
- Do not over-irrigate lawns or fields to avoid standing water in low-lying areas and ditches
- Keep outdoor areas well-maintained, limit areas of dense vegetation and mow lawns regularly to reduce resting places
- Install insect screens on windows, doors and vents and seal any gaps that a mosquito could fly or squeeze through to get inside your home
