

2000 μ mesh width
prevents lice spread

- Stress-free fish under crowding
- Gentle material for minimal shell loss

catchLICE

A fine-mesh net that catches lice during crowding of salmon and trout - avoid the risk of infection on your own location, neighbouring locations and wild fish.

OK Marine's lice net catchLICE collects free-swimming lice before lice treatment of fish in well boats. Control counting shows that up to 60 per cent of lice fall off the salmon during crowding. With traditional cast nets, the lice will remain in the pen and create a significant risk of local re-infection. Preliminary tests show that you catch twice as many lice with catchLICE than with a traditional cast net.

catchLICE has a number of benefits:

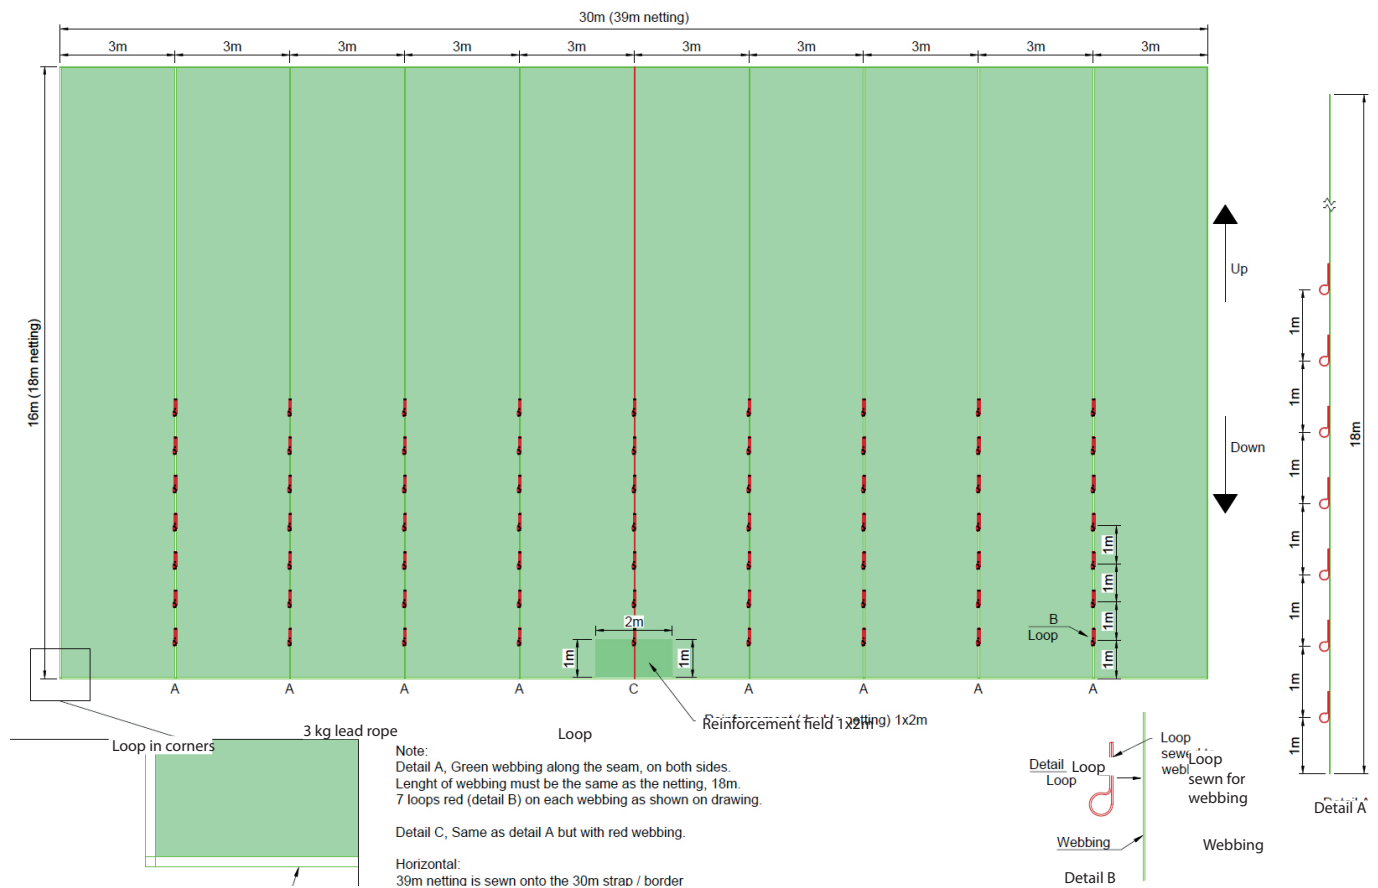

- The lice are larger than the meshes in the net, meaning that you catch lice and avoid re-infection
- Gentle material free of edges means no harm to the fish
- The mesh size is large enough to ensure enough oxygen and good water flow
- The fish is very calm and appears stress-free during crowding
- As user-friendly as an ordinary cast net

Construction

CATCHLICE

catchLICE collects free-swimming lice in various stages, from small motile to large sexually mature lice. This reduces the need for mechanical lice treatments which are very stressful for the fish. Less stress gives a happy and productive fish.
