Breeding Quality

Breeding quality relates to the quality of the breeding programme and suitability for their end use. Descriptions of Breeding Quality should not be affected by condition.

Excellent

Top sires used and top standards of selection and management, i.e. the small percentage of really first class stock. A line with a large culling taken out.

Very Good

Good quality sires used with heavy culling and selection programme – stock with a reputation for growing out/fattening/producing well.
A line with a reasonable culling taken out.

Good

Quality sires used, reasonable selection practices i.e. average stock.
A line that has had some culls removed.

Fair

Average quality sires used, but otherwise little selection practiced.
A line that needs a heavy cull taken out.

Plain

Very poor breeding quality, egg inbreeding, structural or conformation faults expected to limit future growth and/or fattening/production ability. Could apply to culls or at best seconds or thirds from a line of stock.

Frame

Frame specifies the likely mature size, fattening pattern, etc
Frame is relative to the BREED and AGE of the cattle.
Frame is described as Very Large, Large, Medium or Small and is entered as a percentage.

Very Large Frame

Very tall and long bodied. Tendency to very late maturity and difficult to “finish” on some feed types.

Large Frame

Medium Frame

Temperament

Docile

Settled and somewhat dull disposition.
Gentle and easily handled, moves slowly when in a mob, needs encouragement to move away from handler.
Cattle easily handled individually in yards and paddock, without eagerness to return to mob.
Does not pull on headgate when in crush and exits calmly.

Quiet

Displaying a quiet & calm disposition.
Cattle easily handled individually and in mob. Handler in control at all times.
May exhibit some stubbornness. Exits crush promptly, may try to back out of crush, pull on head gate and some flicking of tail.

Slightly Stirry

Manageable but impatient and moves quickly.
Handling individually increases nervous behaviour, and exhibits clear signs of eagerness to return to mob. Handler in control when handled in a mob.
Reluctant to stand quietly in crush, tail flicking, repeated pushing and pulling on headgate. Exits crush briskly.

Stirry

Out of control and jumpy.
Struggles and clearly uncomfortable when handled in a mob.
Runs fenceline and may jump when penned individually.
Continuous tail flicking and bellowing in crush. Large flight distance, exits crush wildly.
Considered scared of human interaction rather than aggressive.
Not recommended for inexperienced handlers.

Aggressive

Aggressive behaviour, fearful, extreme agitation.
Continuous movement when handled in a mob, disrupts handling of other cattle in mob.
May exhibit attack behaviour when handled alone.
May jump or continuously bellow while in crush. Exits crush frantically.

Biosecurity and health information

- Has the owner owned all the cattle in this consignment since birth? Y N
- Does the property of origin have a completed on-farm biosecurity plan? Y N
- Have these cattle been tested for the presence of bovine viral diarrhoea virus (BVDV, pestivirus)? Y N
If tested, were any cattle found to be persistently infected? Y N
- Have these cattle been tested for the presence of BVDV (pestivirus) antibody? Y N
Test results
- Has the source herd had a test for Johne's disease (JD)? Y N
If so, which test? Check Test Sample Test HEC Test (dairy only)
Was the result negative? Y N Pending Date / /
- Has the property of origin had an occurrence of clinical JD in any species in the past five years? Y N Unsure
JDDS of J-BAS of
- BEEF CATTLE: On the property of origin, have cattle been co-grazed with dairy cattle? Y N Unsure
See explanatory note for advice on co-grazing with non-bovine species
- Any other relevant health information

NATIONAL CATTLE HEALTH DECLARATION EXPLANATORY NOTES

OVERVIEW

The Cattle Health Declaration is a legal document. Please complete accurately before signing.

Cattle Health Declarations are a way for producers to provide information about the health status of the cattle they are selling. Buyers should ask vendors for a Declaration and use the information provided to determine the health risks associated with the animals on offer.

Some states/territories require testing or certification additional to that outlined in this document e.g. Johne's disease (JD) in WA and for Enzootic Bovine Leucosis (EBL) in Tasmania. Please check the entry requirements for any interstate movements at:

www.animalhealthaustralia.com.au/what-we-do/epidemic-disease/livestock-movements

The original of this form is to be attached to the National Vendor Declaration (NVD) form accompanying the cattle, if applicable. A duplicate remains with the vendor; it is recommended the vendor retains a copy of this declaration for seven (7) years.

QUESTIONS 3 & 4: BOVINE VIRAL DIARRHOEA VIRUS (PESTIVIRUS) TESTING

Persistently infected animals can be detected by conducting a pestivirus antigen test. This test only needs to be conducted once in an animal's life. Cattle that test positive in most cases are persistently infected animals. Pestivirus antibody testing may be done to check the pestivirus status of the herd. Dairy cattle may be tested through bulk milk testing. Contact your veterinarian for assistance. Producers who don't know the answer to these questions should tick the 'N' box.

QUESTION 5: JOHNE'S DISEASE TESTING

Note: JD is a notifiable disease, so it is important to answer these questions.

Check test – testing of 50 adult animals in the herd (or all eligible animals in a herd if less than 50 adult animals) biased to increase the probability of detecting infection, tested by (pooled) faecal culture or (pooled) HT-J faecal PCR. An ELISA test is available but is not recommended and also not accepted for entry of cattle to WA.

Sample test – screening of the adult herd or a large representative sample of the adult herd by an approved test (pooled) faecal culture or (pooled) HT-J faecal PCR. See note above for ELISA test.

Herd Environmental Culture (HEC) Check Test (for dairy cattle) – a test of a representative sample of faecal material from the yard (see JD in [Cattle Definitions & Guidelines](#) for details). Details are available at www.animalhealthaustralia.com.au/jd-cattle-tools.

QUESTIONS 6 & 7: JOHNE'S DISEASE

Occurrence of JD refers to clinical disease in the herd or on the property(s). Clinical disease is an infected animal with chronic diarrhoea and weight-loss that does not respond to treatment.

The **Johne's Beef Assurance Score** (J-BAS) is a voluntary tool developed for JD risk profiling. Details are available at www.animalhealthaustralia.com.au/jd-cattle-tools. The J-BAS is an initial guide and purchasers should ask for more information about JD in the origin herd (see the JD in Cattle Biosecurity Checklist on the 'JD in cattle' webpage). The *National Farm Biosecurity Reference Manual - Grazing Livestock Production* provides a template to use for the property biosecurity plan. All plans should include the JD in Cattle Biosecurity Plan Checklist.

The **Johne's Disease Dairy Score** (JDDS) is a voluntary tool for JD risk profiling in dairy cattle. Information is available at www.dairyaustralia.com.au/bid

Grazing of non-bovine species – Buyers of cattle from this consignment may consider the grazing of other JD-susceptible species (sheep, goats, alpacas) on the source property as important to their risk-management decisions. These buyers are entitled to seek information on how you have managed disease risks for all your livestock.

TREATMENTS & VACCINATIONS

Provide details on any cattle treatments in the last six (6) months and vaccinations within the last twelve (12) months.

Some manufacturers include more than one of the categories listed in the same vaccine, known as a combination vaccine. If you use a combination vaccine, each agent(s), as appropriate, should be detailed.

For vaccinations to be current, you must have followed the manufacturer's recommendation for vaccination. Typically, young animals or first time vaccinated animals need two (2) doses, followed by annual boosters. As variations to this general rule do occur (e.g. Silirum is given once only), you must use the manufacturer's recommendations.

At the date the declaration is made and as a result of the vaccination(s) given, the animals are considered protected from the diseases marked as treated.

DECLARATION

This section must only be completed by the owner or person responsible for the husbandry of the cattle in the consignment.

For more information on what is fit to travel, please see MLAs *Is it fit to load?* at www.mla.com.au/sifttoaload.

For more information on biosecurity go to www.farmbiosecurity.com.au
