4 Tips On Browsing The Web Safely

1.Use a VPN

VPN's encrypt your data and keep it safe. This masks your location and keeps your information secure.

2.Use the most secure internet browser

The safest web browser depends a little on you. However, it is recommended you use the specific web browser your company asks you to use.

3.Avoid suspicious websites

When deciding if a website is secure, look at the URL. Secure websites will begin with HTTPS and have a lock icon.

4.Protect your passwords

Passwords are the gateway to all of your information. Keeping them safe is key. Using two-factor authentication and password managers can take your password security a step further.
