

Add Value to Your In-Store Experience with Live Weather Feeds

Become a trusted source of information by displaying live weather feeds on your in-store screens. Share daily or five-day weather forecasts for your part of the world and keep your customers up to date so they can plan their next visit with you. Show the current temperature, warn about possible weather events, and more. Your customers will come to rely on your Raydiant screens to have the information they need, when they need it. And the best part—you don't have to do anything. Simply enter your city and state and it updates itself! That means sunny skies ahead for your in-store signage!

The Weather app is included for free with the Raydiant Lite subscription. If you'd like to have access to our additional premium apps, like BlueJeans HD video conferencing and MenuNet menu management, upgrade your membership at any time.

EASILY CONTROL THE LOOK OF YOUR FEED

Control how your live weather feed displays by setting it to show up on your main screen, or as a ticker at the bottom section of your screen using our Multizone function. You can also set it to display on the side of your screen, saving the main screen for other content, like a digital menu or live events calendar.

BUILD TRUST BY GIVING CUSTOMERS UP-TO-DATE INFO

Especially in inclement climates, people are always keeping track of the weather. They want to know how to plan their sunny days, and how to avoid getting caught in the rain and snow. A live weather feed, though not considered the most exciting screen content, is often one of the best ways to attract and engage in-store customers.

AN ALL-IN-ONE PLUG-AND-PLAY SOLUTION

With Raydiant, you get the news, weather, videos, and so much more to keep your in-store customers busy. Simply plug the ScreenRay device into your TV screen and setup takes minutes. Once installed, you can start creating the digital signage experience you want for your customers.

NO-FUSS FEED: SIMPLE TO SET UP AND MAINTAIN

All you need to do is enter your city and state, adjust the temperature unit (if necessary), and your screens will be filled with live weather feeds. You can also easily schedule it to display for a specific duration, and then automatically switch to other screen content at a set time. Want to set different screens (in different locations) to display weather for that specific location? You can do that too.
