

PCI Costpoint Extensibility

Enhance your business capabilities with PCI's Costpoint Extensibility Services.

PCI's Extensibility Services include:

Add or modify fields in an application

Extensibility enables you to configure your current applications within Costpoint. While custom data can be stored in UDEF fields, you are limited in reporting and all data is stored in the UDEF area of a record. Extensibility allows you to embed your custom data requirements into the Costpoint modules, so it is in the logical flow of information.

Extensibility application extensions include:

- Adding fields
- Moving fields
- Adding new data tabs
- Making fields required
- Changing the data flow on the screen
- Changing the default application view

Add a process to Costpoint

Ever wish you could do additional checks or correct formatting as a part of the save process? Extensibility gives you the power to add functionality to data as a part of the insert, update, and delete functions. Data can be manipulated through the use of stored procedures and/or Java code to keep your data cleaner, perform a tailored process, or even integrate your system with external company or 3rd party systems.

Create your own application

In addition to being able to extend software applications with Costpoint, Extensibility provides you with the capability of creating your own applications within the Costpoint framework to store company specific data that is used to support your operations. All of your data is conveniently stored in one place, enhancing its safety and security, with the protection of Costpoint security and your database management system. You are able to better able to leverage your application data from the Costpoint Business Intelligence (CBI) to provide enhanced reporting through report automation or on-demand reporting.
