# 5 WAYS
STAFF AUGMENTATION
## CAN BACKFIRE
ON YOUR DEVOPS PROJECTS

Staff augmentation is the practice of bringing in qualified, certified workers for a duration to help out as needed. It helps managers code visions into being but can become a trap for organizations who make these critical mistakes.

01 The Wrong Skills

Your project may need a different set of skills than you think.

02 Smart Defaults

If your project is in need of something that's already been built before, staff augmentation will have you reinventing the wheel.
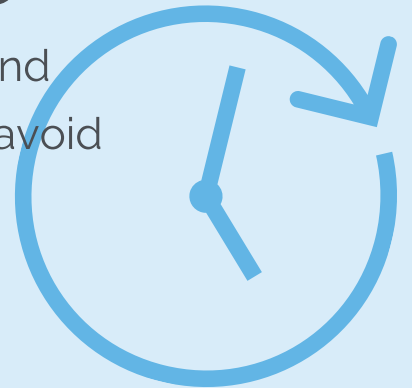

03 Common challenges

Staff augmentation will take longer and cost more if you're uncertain how to avoid and overcome common DevOps challenges.

04 Knowledge Loss

The knowledge required to complete the project will be gone once the mandate is over.

05 Longevity

It's best to partner with firms that take a vested interest in the longevity of your project.

By taking ownership for the design and execution of a project or part of a project, third-parties can help you avoid making these mistakes through the delivery of consulting or professional services.
