ECL for EFB

Increasing flight safety with smart electronic checklists

Benefits

Increased efficiency

Save time during regular or time-critical operations

Faster response time

Provide instant access to the right emergency procedures

Higher safety & accuracy

Minimize risk of human factor related errors

Reliable decision support

Leverage quantitative data to assess scenarios and risks

Paperless workflow

Use digital data from cloud to device

Standardized processes

Establish consistent workflows across your organization

Data analysis

Harvest information and identify trends and behaviors

Built around you

Integrate your assets and tailor-made functionalities

Tried & tested quality

Proven track record, e.g. standard issue at Slovak Air Force

Our Electronic Checklist (ECL) solution is a customizable EFB software, which supports operators and pilots in routine operations and automatically prompts emergency procedures in case of inflight alerts.

Checklists are important assets which support flight crews in the safe operation of the aircraft. They provide standardized sequences of actions in all flight phases and for a variety of operational situations, including operator-specific routines, risk assessment and emergency procedures.

Our ECL solution significantly streamlines the checklist process not only by ensuring flight crews always have the right checklist at hand but also by permitting administrators to flexibly create, customize and update checklists and distribute them across the organization. Our ECL solution fully replaces time-consuming paper-based procedures and reports, which can be generated and submitted to authorities with a single tap. The ECL solution also provides instant access to emergency procedures, cutting pilot response times to a minimum.

Our ECL solution can integrate proprietary methods, legacy data and codes and can also be deployed as a web-based solution. Our cutting-edge development toolbox allows us to take a flexible building-block approach to creating your bespoke solution, which not only saves time and money but also guarantees your customization is built around a robust and reliable functional core.

Key Features

Enhanced user experience

Intuitive and state-of-the-art graphical user interface

Admin tools included

Flexibly create and manage your checklist templates

Multiple-template approach

Create questionnaires, risk assessments, custom checklists and response procedures

Auto-trigger for emergency procedures

Avionics alerts prompt associated checklists

Easy reporting

Summary PDF generated with one click

Quantitative evaluations

Assess scenarios on the basis of checklist inputs

Data analysis

Dashboard checklist executions and retrieved data

Improved workflows and response times

Our ECL solution uses a flexible template-based approach, which provides different types of templates to cover the most frequent requirements:

- **General checklists** are created as a sequence of annotated tasks, which can be nested and/or conditionally branched into sub-sets, while efficiently reusing recurring items.
- **Questionnaires and risk assessment checklists** support the evaluation and reporting of a given scenario, so the associated templates prompts the entry of qualitative information for different situational aspects such as risk mitigation factors or feasibility estimates.

The ECL solution comes with a browser-based admin tool, which supports the company-wide definition and publication of checklists based on the above templates and use cases. The admin tool also provides an execution history for checklists, a dashboard for quantitative analysis and automated e-mail alerts when standard procedures are violated.

If connected to the avionics system, the ECL solution automatically retrieves inflight alerts and triggers the **emergency procedures checklist** for the most critical alert. This saves valuable time which would otherwise be spent on becoming aware of the alert, locating the manual and finding the right page. ECL's emergency trigger can also be implemented for PDF-based manuals.

Our solution can be easily tailored to customer needs, adding bespoke functionality or customizations. Its key technologies have been chosen for portability, so the software can be both be part of a ground station or an EFB suite, e.g. along with other TXT EFB applications.
