Indoor air contains pollutants that can affect human health. Some of these pollutants come from the outdoors, while others come from indoor sources and activities. These can range from cooking, cleaning and second hand smoke, to building materials, consumer products, and home furnishings. These indoor air pollutants can be either in particle or gaseous form, including volatile organic compounds (VOCs). Indoor air quality varies from place to place, and throughout the course of a day. Since most people spend approximately 90% of their time indoors, much of their exposures to airborne pollutants will, naturally, also occur there.
