

Detect. Diagnose. Treat.

Provide optimal health for your pet through regular ultrasound exams

Veterinarians use ultrasound to provide non-invasive imaging that helps evaluate the health of furry family members. Using technology and techniques from human emergency medicine, they gather extensive information to detect potential conditions before they become serious.

Affordable, preventative ultrasound exams can detect hidden conditions.

Ultrasound detects and helps minimize breed-specific conditions

Certain breeds are predisposed to conditions that can be managed when detected early. An initial ultrasound exam establishes a baseline at a normal, healthy age. As your pet ages, periodic ultrasound exams will ensure early detection, preventative care and optimal health.

With *FAST* scanning protocols, your veterinarian can screen for the following:

- abdominal masses
- bladder stones
- liver, gall bladder issues
- kidney disease
- bowel obstruction
- cardiac abnormalities
- respiratory abnormalities
- other injury or age-related disorders

Ultrasound exams are...

- non-invasive
- radiation-free
- affordable
- anesthesia-free [in most cases]
- pain-free

And in most cases, don't require clipping. Ask your veterinarian if they have an IBEX ultrasound today!
