Robotic Process Automation (RPA) Discovery Workshop

RPA Discovery Workshop

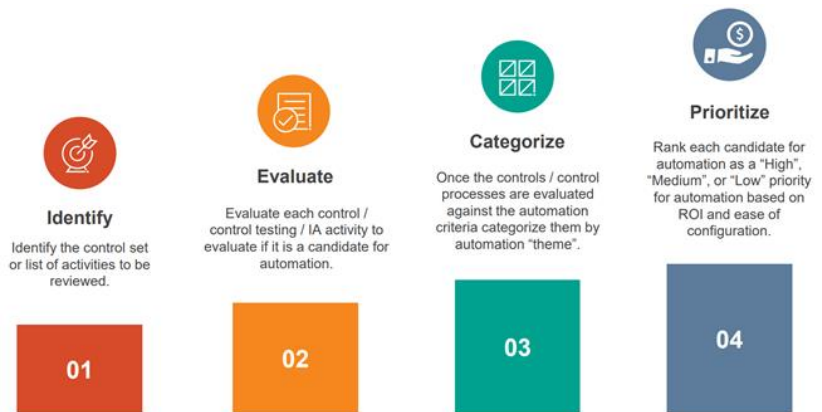

Plan and guide your intelligent journey

Determine which processes are the best candidates and have the highest value and payback potential for RPA.

Deploy a deliberate and measured approach to evaluate whether a process is a good candidate.

- Resist the urge to “automate everything” to avoid the risk of early RPA program failures.
- The goal of the RPA Discovery Workshop is to identify processes that provide high value through automation (*e.g., high risk, high volume, and manual*), though require relatively low to medium effort to automate using RPA.
- UiPath’s Software is able to execute predetermined, rules-based tasks, mimicking human interaction with existing applications to automate a variety of business processes.

RDA will cover everything your team needs to know about the tools, techniques and strategies you can use to get the most out of your data investments.

Workshop Agenda:

- Review related industry use cases
- Define scope, applicability and impact of potential robotic processing
- Alignment on key requirements and evaluation criteria
- Pilot overview & planning

Output:

- Prioritized list of processes candidates
- Delivery options model
- RPA business case
