

NXgate

THE SMART CONTROL ON YOUR NETWORK

NEXTWORKS
ENGINEERING FORWARD

When network management becomes SMART

With NXgate, you can configure and control all the parameters related to network access, be it your home or office network

It's not a firewall; it sits besides your firewall and cooperate with it, implementing a total network security, and full control to the connected users and devices

SMART interface

A simple **web browser** allows you to manage the available features.
No need for specific technical skills or installed software.
Everything can be viewed and configured from your desktop/laptop, tablet or smartphone.

User management and control

- Alerts
- Parental Control
- Users permissions
- App blacklisting (e.g. Facebook, Youtube, etc.)
- Bandwidth management

Ability to define **different users categories**, assigning each one with specific permissions.
In particular, it is possible to discriminate the network access or limit the bandwidth depending on the type of user, and/or restrict access to certain services or applications (e.g. Facebook, Youtube, Google, etc.).

Report & Monitoring

Information is available **real-time** through extremely intuitive web reports, which include both a bird's eye view of the entire network, and the **details of individual users traffic** (services used, timelines, etc.)

Monitoring

Firewall

Devices / Users

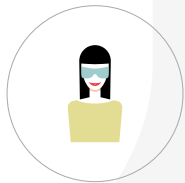

Drop / Shaping

Alerting

Home

At home, manage your network easily and securely

KID

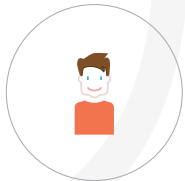

TEEN

ADULT

Create a dedicated profile for each family member

Advanced parental control over your kids' web activity

- Set your own time limits for using apps, social networks, etc.
- Blacklist / whitelist contents
- Put online/offline selected devices on your home network

Monitor online time and access to services for each user / device / site / app.

 **47 min**

 **0 min**

 **18 min**

 **200 min**

 **32 min**

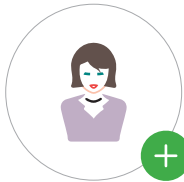

Business

Everything is under control with NXgate

Create specific user profiles

Restrict the access to specific websites or apps

Limit the bandwidth allowed to certain users

Check real-time the traffic generated by the individual users, the services used, and the time spent.

Yachting

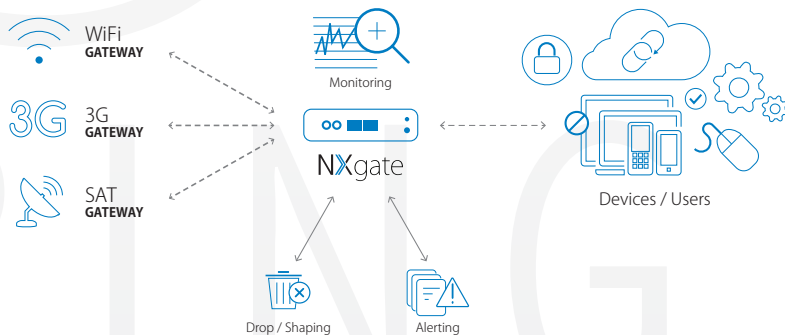

With NXgate you will be sailing in total safety and comfort

Create different User Profiles: Shipowner, Guest, Captain, Crew.

Define specific **bandwidth** and **speed limits** for each group of users; e.g. you can guarantee that the shipowner uses the fastest and most expensive channel, still allowing the crew to be online. **Select the output channel:** single, multiple or aggregated (load balancing and failover) and improve the network performances.

Need to allow the crew to use basic services (e.g. email and Skype), but prevent them from streaming or downloading heavy files while the shipowner is onboard? Apply a **user / group / channel policy** to decide who can use a specific service, and blocking others.

Any children or kids onboard?
Set up **Parental Control** just like at home.

Faster internet connection

Link aggregation mode
